**Priority Queues** 

1

# **Priority Queue ADT**

- A priority queue stores a collection of entries
- Each entry is a pair (key, value)
- Main methods of the Priority
   Queue ADT
  - insert(k, x)inserts an entry with key kand value x
  - removeMin()
     removes and returns the entry with smallest key

- Additional methods
  - min()
     returns, but does not
     remove, an entry with
     smallest key
  - size(), isEmpty()
- Applications:
  - Standby flyers
  - Auctions
  - Stock market

**Total Order Relations** 

- Keys in a priority queue can be arbitrary objects on which an order is defined
- Two distinct entries in a priority queue can have the same key
- Mathematical concept of total order relation ≤
  - Reflexive property: x ≤ x
  - Antisymmetric property:  $x \le y \land y \le x \Rightarrow x = y$
  - Transitive property:  $x \le y \land y \le z \Rightarrow x \le z$

## **Entry ADT**

© 2010 Goodrich, Tamassia

- An entry in a priority queue is simply a keyvalue pair
- Priority queues store entries to allow for efficient insertion and removal based on keys
- Methods:
  - getKey: returns the key for this entry
  - getValue: returns the value associated with this entry

As a Java interface:

```
* Interface for a key-value
```

- \* pair entry
- \*\*/

public interface Entry<K,V>
{
 public K getKey();

public \( \text{getRey(),} \)
public \( \text{y getValue();} \)

### **Comparator ADT**

- A comparator encapsulates the action of comparing two objects according to a given total order relation
- A generic priority queue uses an auxiliary comparator
- The comparator is external to the keys being compared
- When the priority queue needs to compare two keys, it uses its comparator

- Primary method of the Comparator ADT
- compare(x, y): returns an integer i such that
  - i < 0 if a < b,</p>
  - i = 0 if a = b
  - i > 0 if a > b
  - An error occurs if a and b cannot be compared.

# **Example Comparator**

```
    Lexicographic comparison of 2-D

                                                Point objects:
    points:
                                                /** Class representing a point in the
/** Comparator for 2D points under the standard lexicographic order. */
                                                    plane with integer coordinates */
                                                public class Point2D
public class Lexicographic implements
                                                  protected int xc, yc; // coordinates
    Comparator {
                                                  public Point2D(int x, int y) {
   int xa, ya, xb, yb;
                                                     xc = x;
   public int compare(Object a, Object b)
                                                     yc = y;
    throws ClassCastException {
     xa = ((Point2D) a).getX();
                                                  public int getX() {
     ya = ((Point2D) a).getY();
                                                          return xc;
     xb = ((Point2D) b).getX();
     yb = ((Point2D) b).getY();
                                                  public int getY() {
     if (xa != xb)
                                                          return yc;
          return (xb - xa);
    else
          return (yb - ya);
```

### **Priority Queue Sorting**

- We can use a priority queue to sort a set of comparable elements
  - Insert the elements one by one with a series of insert operations
  - Remove the elements in sorted order with a series of removeMin operations
- The running time of this sorting method depends on the priority queue implementation

#### Algorithm *PQ-Sort*(S, C)

**Input** sequence S, comparator C for the elements of S

**Output** sequence S sorted in increasing order according to C

 $P \leftarrow$  priority queue with comparator C

while  $\neg S.isEmpty$  ()

 $e \leftarrow S.removeFirst()$ 

P.insert (e, Ø)

while ¬P.isEmpty()

 $e \leftarrow P.removeMin().getKey()$ 

S.addLast(e)

# Sequence-based Priority Queue

**Priority Queues** 

Implementation with an unsorted list

#### Performance:

© 2010 Goodrich, Tamassia

- insert takes O(1) time since we can insert the item at the beginning or end of the sequence
- removeMin and min take
   O(n) time since we have to traverse the entire sequence to find the smallest key

Implementation with a sorted list

6

#### Performance:

- insert takes O(n) time since we have to find the place where to insert the item
- removeMin and min take
   O(1) time, since the
   smallest key is at the
   beginning

Priority Queues

### Selection-Sort

- Selection-sort is the variation of PQ-sort where the priority queue is implemented with an unsorted sequence
- Running time of Selection-sort:
  - 1. Inserting the elements into the priority queue with n insert operations takes O(n) time
  - 2. Removing the elements in sorted order from the priority queue with *n* removeMin operations takes time proportional to

$$1 + 2 + ... + n$$

□ Selection-sort runs in  $O(n^2)$  time

### **Insertion-Sort**

- Insertion-sort is the variation of PQ-sort where the priority queue is implemented with a sorted sequence
- Running time of Insertion-sort:
  - Inserting the elements into the priority queue with n insert operations takes time proportional to

$$1 + 2 + ... + n$$

- 2. Removing the elements in sorted order from the priority queue with a series of n removeMin operations takes O(n) time
- Insertion-sort runs in  $O(n^2)$  time

# **Insertion-Sort Example**

4	Sequence S	Priority queue P
Input:	(7,4,8,2,5,3,9)	0
Phase 1		
(a)	(4,8,2,5,3,9)	(7)
(b)	(8,2,5,3,9)	(4,7)
(c)	(2,5,3,9)	(4,7,8)
(d)	(5,3,9)	(2,4,7,8)
(e)	(3,9)	(2,4,5,7,8)
(f)	(9)	(2,3,4,5,7,8)
(g)	0	(2,3,4,5,7,8,9)
Phase 2		
(a)	(2)	(3,4,5,7,8,9)
(b)	(2,3)	(4,5,7,8,9)
(a)	 (2 2 4 E 7 9 0)	
(g)	(2,3,4,5,7,8,9)	U iii iii ii

Priority Queues

# **In-place Insertion-Sort**

- Instead of using an external data structure, we can implement selection-sort and insertion-sort in-place
- A portion of the input sequence itself serves as the priority queue
- For in-place insertion-sort
  - We keep sorted the initial portion of the sequence
  - We can use swaps instead of modifying the sequence
